Flush or clear the DNS Resolver cache in Windows 10 and 11

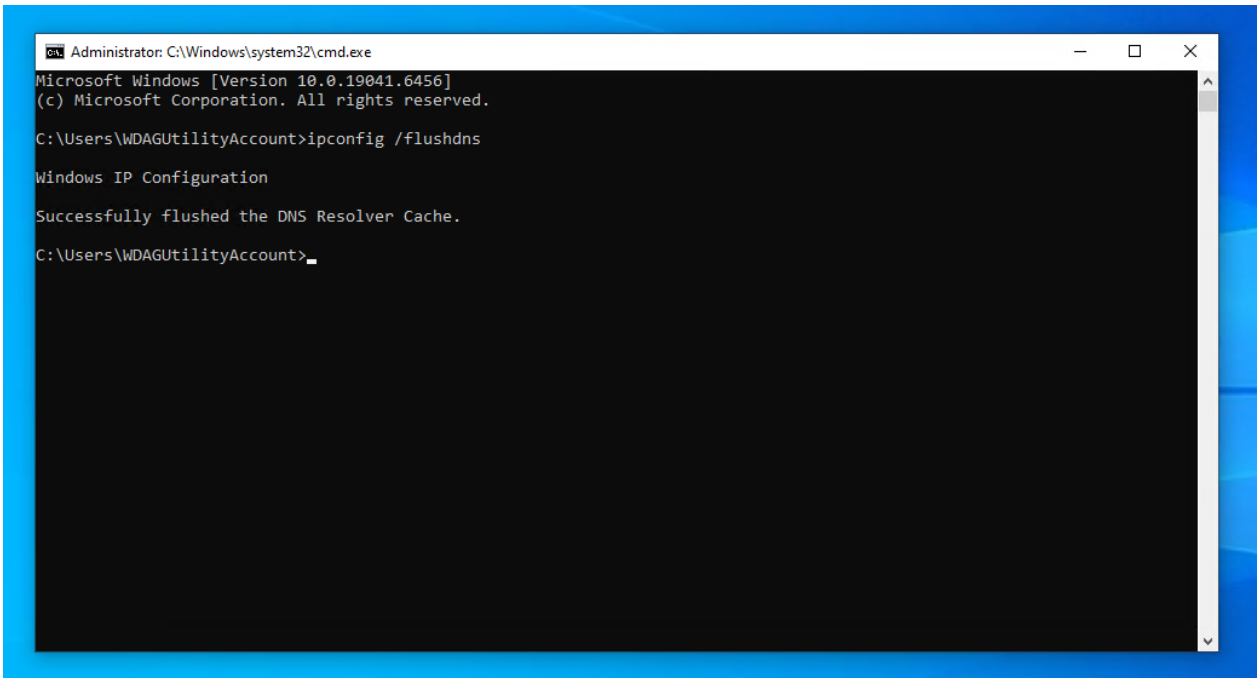

In Windows 10 and 11, you may flush or clear the DNS Resolver cache to remove old or bad cache stored on your computer. This means completely removing all the information stored within the cache, and can help troubleshoot website connectivity issues.

Flush the DNS cache in Windows Command Prompt:

1. Press the **Windows Key** + **R** on your keyboard, this will open *Run* in Windows.

2. As shown in the image above, type `cmd` into the textbox and press **Enter** on your keyboard.

3. Type `ipconfig /flushdns` into Windows Command Prompt, and press **Enter**.

4. If the command above has been executed successfully with the appropriate permissions, you will receive a success response in the command terminal. The DNS Resolver cache has now been cleared.

5. To exit Windows Command Prompt, type `exit` or click the **Red X** at the top right corner of the window.
